========================= CS764 Lab 01a =========================

This lab contains the setup and ground rules for the tasks.

- It helped to know what is a virtual environment and need of it.

- We will gain the knowledge of creating a virtual environment,
  activating it and deactivating the environment (when not in use).

- I came to know that all the packages/modules installed along with
  their versions can easily be checked using a simple command

          pip freeze

  and can be saved as a text file requirements.txt

  The user who wants to run our project/code can install the modules
  and libraries required by running the command

          pip install -r requirements.txt

- This is a basic set-up task which any individual can understand by
  reading and can set up the required environment by following the
  instructions carefully.
